

Cognitive Capacity Prediction Report: jepa (strength of approach, low score)

Most recent data: 2012 Prediction for: 2021 Report date: 17 January 2025

Your predicted capacity in 2021	60% likely between	90% likely between	Population average	Your predicted risk
48	0 and 101	0 and 130	157	High

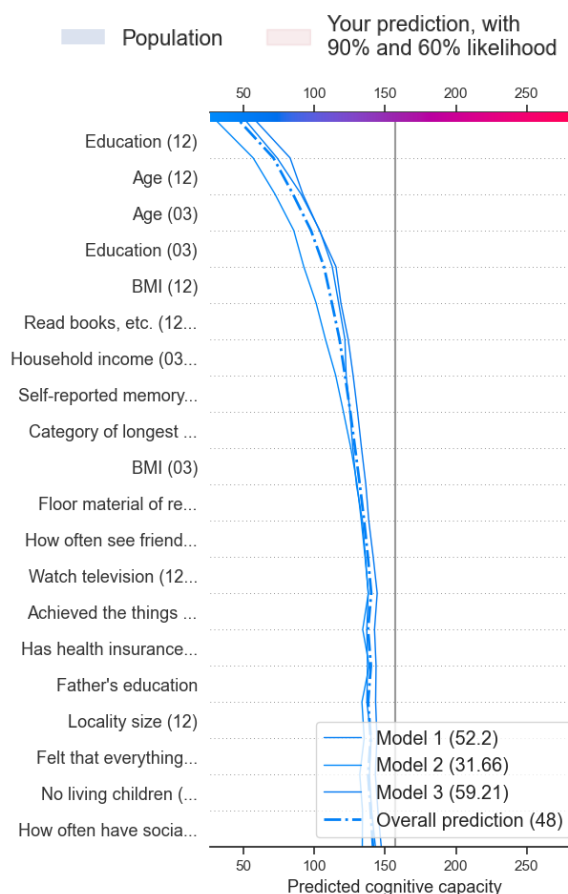

How to read this report

This report should be thought of as a risk assessment of future cognitive capacity based on your social determinants - the answers you gave in your questionnaire. It does not consider other factors. If someone else gave the same answers, they would get the same report, although their actual health may be very different to yours. It also doesn't tell us about cause, just that certain combinations of factors are linked to better cognitive capacity.

What do the charts mean?

Cognitive capacity is scored on a range of 0 to 384. The top chart shows your predicted score and likely range, compared to the overall population. The bottom chart shows the important factors in your individual prediction, with the most important at the top. Starting at the bottom, the line moves to the left when a factor reduces your predicted score, and to the right when it increases your predicted score.

How accurate are predictions?

Our research finds that 90% of predictions are within 63 of the assessed score, although our confidence varies for different predictions depending on the social determinants. To guide you, we provide estimated ranges for your prediction, with 90% and 60% likelihood.

We will call you in a few weeks to check-in with you. If you have any questions about these results in the meantime, please call (# here), at any time.
