And there's the picture. The mother is washing the dishes, but not very attentively, allowing the sink to overflow onto the floor. And she is drying a dish. Kids are trying to get into the cookie jar. They have managed to get into it. The boy is standing on a stool, which is in the process of falling over, while he's trying to hand the cookie to his younger sister, who is reaching for it. The window is open, overlooking the garden. The wind is blowing slightly. It's ruffling the curtains. It is sun.

Interpretation

The individual's language use indicates healthy cognitive function:

- Their speech includes clear descriptions.
- They demonstrate lexical richness.
- They maintain a coherent narrative.

Spectrogram + SHAP Visualization

Interpretation

- No informative pauses (e.g., pauses before nouns) were detected.
- Minimal signs of low energy levels were observed in the voice (see Spectrogram highlighted in green).
- Speech was rhythmic, with no flat or monotonous segments (see Entropy curve).
- The voice was stable (standard deviation in Shimmer was low).
- Control over vocal folds was relatively acceptable, of some fluctuation observed (see F0 curve).
- Tongue-lip coordination for phoneme and syllable production was acceptable (see F3 curve).

Overall, there were minimal signs of cognitive impairment, suggesting the individual is likely cognitively healthy.

CONSIDERATIONS:

Please be advised that the sensitivity of this system is not 100%. A more comprehensive evaluation should include the individual's medical history and additional cognitive assessments.

To reduce the risk of cognitive status, evidence-based studies suggested:

- Having regular exercise
- Connecting with family/community
- Limiting alcohol intake
